

## Five reasons why you should choose Delta Controls

### Reason 1: Simple is better.

Advanced building control systems shouldn't be complex to operate. That's why we've done a number of things to simplify matters. Our control systems have been designed by application engineers who know the challenges installers face on the job and have developed our control systems accordingly.

Our graphical user interface is also simple to use. If you can point and click, you can master our system. With more than 150 embedded objects—everything from air handling units to chillers—it's easy to customize your graphical interface to truly reflect the personality of your buildings as well as your information needs.

What's more, our software auto discovers all BACnet devices, making the commissioning of fully integrated systems remarkably easy.

### Reason 2: You're the boss.

A building management system should work the way owners and managers want, not the way manufacturers dictate. We can program our system to meet your exact specifications. Or, because our control language is quite easy to learn, managers also have the option to program their systems themselves to save on installation costs.

### Reason 3: Free to choose, not forced to use.

Delta Controls believes that building owners and managers should be able to use the best technology for their buildings, no matter where it's produced. Which is why we have been on the leading edge of developing the open BACnet protocol from the beginning, and have developed the most robust top to bottom BACnet system in the industry.

The result? You can control all your building functions—HVAC, lighting, access, CCTV and more—from a single operator workstation or any remote site with Web access.

Delta can seamlessly integrate BACnet systems from different manufacturers so that they talk to one another, and incorporate any company's new technology in the future. So you're not held captive by a proprietary system and are free to choose the best technology available that meets your requirements.

### Reason 4: Time is money. And so is reliability.

Delta systems install easier and faster, saving time and money. Our programming language is easy to learn; our graphical user interface is purposefully intuitive. So adapting our soft-

ware to your building requirements is as easy as point and click. We also put new products through an extensive battery of tests—from simulation walls to real world situations—to ensure performance.

Once installed, Delta Controls work tirelessly to enhance your building's performance. In fact, our products work so well they rarely need servicing during their life cycle.

### Reason 5: We go about business the right way.

If something goes wrong on a project, as things sometimes do, Delta's commitment is to make every reasonable effort to correct the situation to ensure that we have satisfied customers when the project is complete. Be it providing technical support remotely or dispatching personnel to a job site, Delta does it right.

Five reasons. Add them all up and you arrive at one inescapable conclusion: At Delta Controls integration is simplified, customers are satisfied.
